

APPENDIX to:

"Racial Inequalities in Adolescents' Exposure to Racial and Socioeconomic Segregation, Collective Efficacy, and Violence"

by Nicolo P. Pinchak, Christopher R. Browning, Catherine A. Calder, and Bethany Boettner

Appendix

Sample Information and Supplemental Figure

Appendix Table 1. Comparison of Adolescent Health and Development in Context Sample Characteristics to Estimated Population of Youth and Households

Appendix Figure 1. Distribution of home neighborhood concentrated disadvantage by race for the full sample of Black and white AHDC youth.

Appendix Figure 2. Distribution of home neighborhood concentrated disadvantage by race for the census tract fixed effects sample of Black and white AHDC youth.

Appendix Figure 3. The effect of respondent Black (vs. white) race on non-home exposure to proportion Black and $\ln(\text{violent crime})$ in their original metrics.

Full Tables for Models Presented in Table 2

Appendix Table 2. Linear regression models for non-home exposure to concentrated disadvantage with cluster robust standard errors.

Appendix Table 3. Linear regression models for non-home exposure to proportion Black with cluster robust standard errors.

Appendix Table 4. Linear regression models for non-home exposure to collective efficacy with cluster robust standard errors.

Appendix Table 5. Linear regression models for non-home exposure to violent crime with cluster robust standard errors.

Full Tables for Interaction Models Presented in Table 3

Appendix Table 6. Linear regression models for non-home exposure to concentrated disadvantage with cluster robust standard errors and interactions.

Appendix Table 7. Linear regression models for non-home exposure to proportion Black with cluster robust standard errors and interactions.

Appendix Table 8. Linear regression models for non-home exposure to collective efficacy with cluster robust standard errors and interactions.

Appendix Table 9. Linear regression models for non-home exposure to violent crime with cluster robust standard errors and interactions.

Full Tables for Interaction Models Presented in Table 3: Non-Home Exposures Excluding School Time

Appendix Table 10. Linear regression models for non-home exposures with cluster robust standard errors, excluding school-time.

Appendix Table 11. Linear regression models for non-home exposure to concentrated disadvantage with cluster robust standard errors and interactions, excluding school-time.

Appendix Table 12. Linear regression models for non-home exposure to proportion Black with cluster robust standard errors and interactions, excluding school-time.

Appendix Table 13. Linear regression models for non-home exposure to collective efficacy with cluster robust standard errors and interactions, excluding school-time.

Appendix Table 14. Linear regression models for non-home exposure to violent crime with cluster robust standard errors and interactions, excluding school-time.

APPENDIX: RACIAL SEGREGATION IN ACTIVITY SPACE

Full Tables for Models Presented in Table 2: Non-Home Exposure to Census Tract Features

Appendix Table 15. Linear regression models for non-home exposures based on census tracts with cluster robust standard errors.

Appendix Table 16. Linear regression models for non-home exposure to concentrated disadvantage based on census tracts with cluster robust standard errors and interactions.

Appendix Table 17. Linear regression models for non-home exposure to proportion Black based on census tracts with cluster robust standard errors and interactions.

Appendix Table 18. Linear regression models for non-home exposure to collective efficacy based on census tracts with cluster robust standard errors and interactions.

Full Tables for Non-home Collective Efficacy Models Presented in Tables 2 and 3: Measuring Collective Efficacy with Only Home Neighborhood Reports

Appendix Table 19. Linear regression models for non-home collective efficacy, measuring collective efficacy with home neighborhood reports.

Sample Information and Supplemental Figure

Appendix Table 1. Comparison of Adolescent Health and Development in Context Sample Characteristics to Estimated Population of Youth and Households

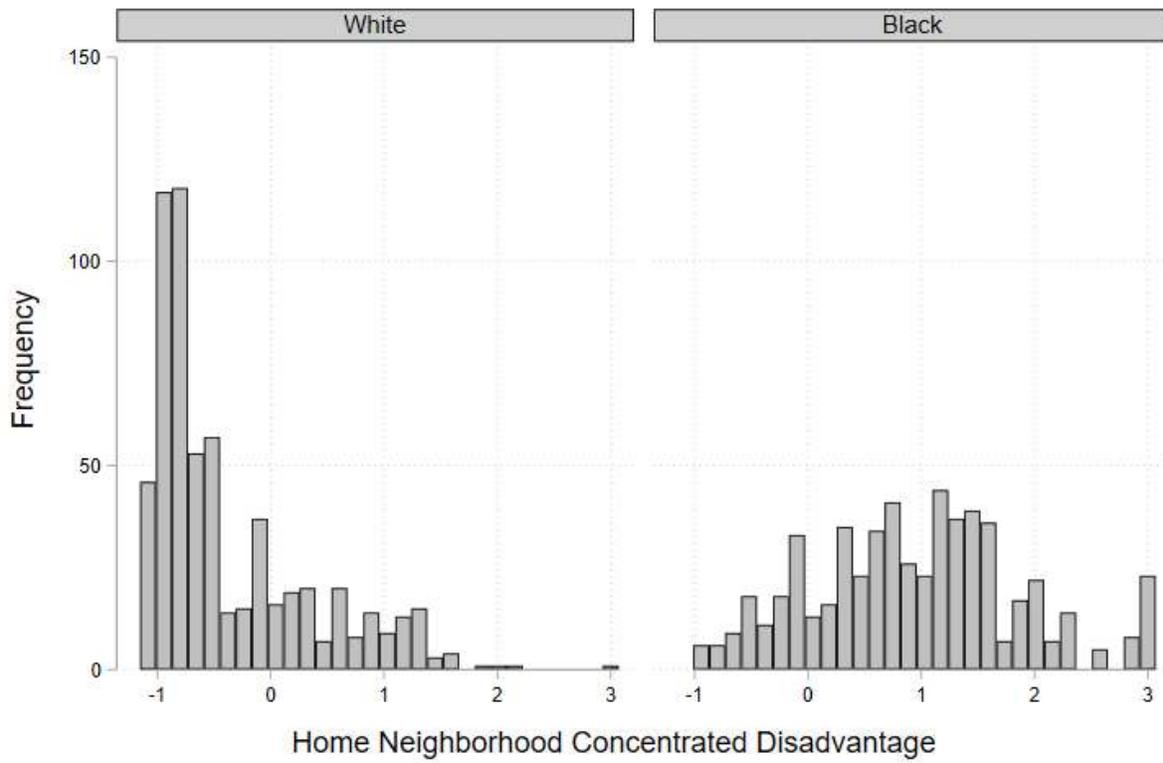

Youth Race/Ethnicity	Population Estimate	AHDC Sample
Non-Hispanic White	48.90%	47.60%
Non-Hispanic Black	31.90%	37.90%
Hispanic (any race)	8.70%	5.40%
Asian	2.20%	1.50%
Multiracial	7.90%	8.40%
Other	0.40%	0.10%
Household Income	Population Estimate	AHDC Sample
\$10,000 or below	13.00%	13.50%
\$10,001 - \$20,000	12.10%	11.00%
\$20,001 - \$30,000	10.30%	11.80%
\$30,001 - \$40,000	10.60%	10.30%
\$40,001 - \$50,000	7.60%	7.70%
\$50,001 - \$60,000	6.90%	6.20%
\$60,001 - \$100,000	17.80%	17.00%
\$100,001 - \$150,000	11.30%	11.10%
\$150,001 - \$200,000	5.30%	5.70%
Above \$200,000	5.20%	5.70%

Notes: Population estimates are derived from the American Community Survey 2012-2014 data from the IPUMS Integrated Public Use Microdata Series (Ruggles et al. 2021). We limit the ACS data to the 6 public use microdata areas (PUMAs) for which the majority of the PUMA area falls within the AHDC study area inside the beltway loop freeway I-270. PUMAs are the smallest spatial unit for which individual and household data is available. Youth racial composition is calculated for the entire population ages 11-17 living in the estimated study area, weighted at the individual level to account for sampling design of the ACS. Household income is calculated for households with at least one child age 11-17, using household level weights.

Ruggles, Steven, Sarah Flood, Sophia Foster, Ronald Goeken, Jose Pacas, Megan Schouweiler, and Matthew Sobek. 2021. *IPUMS USA: Version 11.0 [Dataset]*. Minneapolis, MN: IPUMS. <https://doi.org/10.18128/D010.V11.0>.

Notes: Models including an interaction for Black * Tract Disadvantage are two-level linear multilevel models clustering on census tracts, and include a random slope term for Black (vs. white) respondent. All other models are single-level linear regression models with cluster robust standard errors. The following variables are z-score standardized: Tract concentrated disadvantage, tract collective efficacy, non-home collective efficacy, and non-home concentrated disadvantage.

*p < .05; **p < .01; ***p < .001; two-tailed tests.

Notes: Models including an interaction for Black * Tract Disadvantage are two-level linear multilevel models clustering on census tracts, and include a random slope term for Black (vs. white) respondent. All other models are single-level linear regression models with cluster robust standard errors. The following variables are z-score standardized: Tract concentrated disadvantage, tract collective efficacy, non-home collective efficacy, and non-home concentrated disadvantage.

Notes: Models including an interaction for Black * Tract Disadvantage are two-level linear multilevel models clustering on census tracts, and include a random slope term for Black (vs. white) respondent. All other models are single-level linear regression models with cluster robust standard errors. The following variables are z-score standardized: Tract concentrated disadvantage, tract collective efficacy, non-home collective efficacy, and non-home concentrated disadvantage.

*p < .05; **p < .01; ***p < .001; two-tailed tests.

Notes: Models including an interaction for Black * Tract Disadvantage are two-level linear multilevel models clustering on census tracts, and include a random slope term for Black (vs. white) respondent. All other models are single-level linear regression models with cluster robust standard errors. The following variables are z-score standardized: Tract concentrated disadvantage, tract collective efficacy, non-home collective efficacy, and non-home concentrated disadvantage.

N: Individual-level	1180	1180	674	1180	674	1180	674

*p < .05; **p < .01; ***p < .001; two-tailed tests.

Notes: Models including an interaction for Black * Tract Disadvantage are two-level linear multilevel models clustering on census tracts, and include a random slope term for Black (vs. white) respondent. All other models are single-level linear regression models with cluster robust standard errors. The following variables are z-score standardized: Tract concentrated disadvantage, tract collective efficacy, non-home collective efficacy, and non-home concentrated disadvantage.

Full Tables for Non-home Collective Efficacy Models Presented in Tables 2 and 3: Measuring Collective Efficacy with Only Home Neighborhood Reports

Appendix Table 19. Linear regression models for non-home collective efficacy, measuring collective efficacy with home neighborhood reports.

	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6	Model 7
